broad and more approximate on the sternal side pieces. Legs rather slender, femora not toothed, terminal joint of tarsi projecting a distance rather less than the length of the bases of the preceding joint; claws simple.

Length 1.8 mm.; width .9 mm.

Awence, Manitoba, Sept. 8, (Cridle). A small species belonging to the squamulatus group of Dietz, in which it may best follow persimilis, though not agreeing closely with any species of the group. The small size and lack of true scales on the upper surface distinguishes it from all but albopterus, which differs in its erect, coarser vestiture among other characters.

LECTOTYPES OF THE SPECIES OF HYMENOPTERA (EXCEPT APOIDEA) DESCRIBED BY ABBÉ PROVANCHER.
